

# Predicting human gaze using low-level saliency combined with face detection (W49)

*Moran Cerf, Jonathan Harel, Wolfgang Einhäuser, Christof Koch*

**Humans look at faces  
(early and irrespective of task)**

**Combined Model  
(face + low-level saliency)**

- Combined model outperforms saliency in predicting fixations.
  - Holds even **if there is no face in the image** (hallucinated faces).
- => Specialized bottom-up “face channel” for human attention.
