S1 amLDS inference: Kalman smoothing

The goal is to estimate the posterior distribution of the latent state \mathbf{z}_t using all available measurements $\mathbf{x}_{1:T}$. This posterior has joint multivariate Gaussian statistics with marginal parameters $\mu_{t|T}$ and $\Sigma_{t|T}$, which is computed in two stages, a forward pass corresponding to Kalman filtering and a backward pass which implements Kalman smoothing. We will use the double index $t|t'$ to denote both the time index of the latent variable, t , and to signal the range of observations that the posterior is conditioned on t' , namely, $P(\mathbf{z}_t | \mathbf{x}_{1:t'}, \theta) = \mathcal{N}(\mu_{t|t'}, \Sigma_{t|t'})$.

The Kalman filtering involves recursive updates in a forward pass, alternating between updates that propagate beliefs about the current state \mathbf{z}_t given only the previous state \mathbf{z}_{t-1} , using the stimulus-specific parameters:

$$\mu_{t|t-1} = \mathbf{A}_k \mu_{t|t-1} + \mathbf{b}_{k,t} \quad (1)$$

$$\Sigma_{t|t-1} = \mathbf{A}_k \Sigma_{t|t-1} \mathbf{A}_k^\top + \mathbf{Q}_k, \quad (2)$$

and steps that incorporate evidence from the current observation \mathbf{x}_t , via the animal-specific observation model parameters:

$$\mu_{t|t} = \mu_{t|t-1} + \mathbf{K}_t (\mathbf{x}_t - \mathbf{C}_m \mu_{t|t-1}) \quad (3)$$

$$\Sigma_{t|t} = \Sigma_{t|t-1} + \mathbf{K}_t \mathbf{C}_m \Sigma_{t|t-1} \quad (4)$$

$$\mathbf{K}_t = \Sigma_{t|t-1} \mathbf{C}_m^\top (\mathbf{C}_m \Sigma_{t|t-1} \mathbf{C}_m^\top + \mathbf{R}_m)^{-1}, \quad (5)$$

where \mathbf{K}_t denotes the Kalman gain.

The smoothing (backward pass) incorporates evidence from the later part of the observation sequence:

$$\mu_{t|T} = \mu_{t|t} + \mathbf{F}_t (\mu_{t+1|T} - \mu_{t+1|t}) \quad (6)$$

$$\Sigma_{t|T} = \Sigma_{t|t} + \mathbf{F}_t (\Sigma_{t+1|T} - \Sigma_{t+1|t}) \mathbf{F}_t^\top \quad (7)$$

$$\mathbf{F}_t = \Sigma_{t|t} \mathbf{A}_k^\top \Sigma_{t+1|t}^{-1}, \quad (8)$$

with \mathbf{F}_t denoting the smoothing analogue of the Kalman gain.

Figure S1: **Manifold alignment across animals.** Animal-specific loading matrices C_m estimated using amLDS from the olfactory bulb neural datasets. The observation space (y-axis) includes the set of electrodes that are active (not damaged) in all animals.

Checklist

1. For all authors...
 - (a) Do the main claims made in the abstract and introduction accurately reflect the paper's contributions and scope? [\[Yes\]](#) Yes, it's accurate.
 - (b) Did you describe the limitations of your work? [\[Yes\]](#) See Section 2 and Discussion.
 - (c) Did you discuss any potential negative societal impacts of your work? [\[N/A\]](#) We don't foresee any obvious negative societal impact from this work.
 - (d) Have you read the ethics review guidelines and ensured that your paper conforms to them? [\[Yes\]](#) Yes, it conforms.
2. If you are including theoretical results...
 - (a) Did you state the full set of assumptions of all theoretical results? [\[Yes\]](#) See Section 2.
 - (b) Did you include complete proofs of all theoretical results? [\[Yes\]](#) See Section 2 and Supplementary 1.
3. If you ran experiments...
 - (a) Did you include the code, data, and instructions needed to reproduce the main experimental results (either in the supplemental material or as a URL)? [\[Yes\]](#) A full description of the model and simulations is provided on Sections 2-4. Supplementary code is provided to replicate the results. A complete description of the neural data is provided on Section 4.
 - (b) Did you specify all the training details (e.g., data splits, hyperparameters, how they were chosen)? [\[Yes\]](#) See Sections 2-4
 - (c) Did you report error bars (e.g., with respect to the random seed after running experiments multiple times)? [\[Yes\]](#) See figure captions and Sections 3 and 4
 - (d) Did you include the total amount of compute and the type of resources used (e.g., type of GPUs, internal cluster, or cloud provider)? [\[Yes\]](#) See Section 3. amLDS memory and computational demands are really low, both parameter learning and inference can run on a laptop computer.
4. If you are using existing assets (e.g., code, data, models) or curating/releasing new assets...
 - (a) If your work uses existing assets, did you cite the creators? [\[Yes\]](#) We use code from scikit-learn, which we credit in reference [27].
 - (b) Did you mention the license of the assets? [\[N/A\]](#)
 - (c) Did you include any new assets either in the supplemental material or as a URL? [\[Yes\]](#) The model and a user tutorial is provided as supplementary material.
 - (d) Did you discuss whether and how consent was obtained from people whose data you're using/curating? [\[N/A\]](#)
 - (e) Did you discuss whether the data you are using/curating contains personally identifiable information or offensive content? [\[N/A\]](#)
5. If you used crowdsourcing or conducted research with human subjects...
 - (a) Did you include the full text of instructions given to participants and screenshots, if applicable? [\[N/A\]](#)
 - (b) Did you describe any potential participant risks, with links to Institutional Review Board (IRB) approvals, if applicable? [\[N/A\]](#)
 - (c) Did you include the estimated hourly wage paid to participants and the total amount spent on participant compensation? [\[N/A\]](#)
