1 Proof of Eq. 8

$$\phi(G, F) \leq \|\delta_\tau(F)\|_0 \ll \|\delta_{2\tau}(\mathbf{I}_D)\|_0 - \|\delta_\tau(\mathbf{k}_p)\|_0 \leq \phi(\mathbf{k}_p, \mathbf{I}_D)$$

$$\phi(G, F) = \sum_{i,j} \text{sign}(\delta_\tau(G_{ij} - F_{ij})) \quad (1)$$

$$= \sum_{i,j} \text{sign}(\delta_\tau(F_{ij}S_{ij} - F_{ij})) \quad (2)$$

$$= \sum_{F_{ij} < \tau} \text{sign}(\delta_\tau(F_{ij}S_{ij} - F_{ij})) + \sum_{F_{ij} \geq \tau} \text{sign}(\delta_\tau(F_{ij}S_{ij} - F_{ij})) \quad (3)$$

$$\leq \sum_{F_{ij} < \tau} \text{sign}(\delta_\tau(F_{ij}(S_{ij} - 1))) + \sum_{F_{ij} \geq \tau} \text{sign}(\delta_\tau(F_{ij})) \quad (4)$$

$$= 0 + \sum_{F_{ij} \geq \tau} \text{sign}(\delta_\tau(F_{ij})) \quad (5)$$

$$= \|\sigma_\tau(F)\|_0 \quad (6)$$

$$\phi(k_p, I_D) = \sum_{i,j} \text{sign}(\delta_\tau([k_p]_{ij} - [I_D]_{ij})) \quad (7)$$

$$= \sum_{[k_p]_{ij} > \tau} \text{sign}(\delta_\tau([k_p]_{ij} - [I_D]_{ij})) + \sum_{[k_p]_{ij} < \tau} \text{sign}(\delta_\tau([k_p]_{ij} - [I_D]_{ij})) \quad (8)$$

$$\geq \sum_{[k_p]_{ij} < \tau} \text{sign}(\delta_\tau([k_p]_{ij} - [I_D]_{ij})) \quad (9)$$

$$\geq \sum_{[k_p]_{ij} < \tau, [I_D]_{ij} > 2\tau} \text{sign}(\delta_\tau([k_p]_{ij} - [I_D]_{ij})) \quad (10)$$

$$\geq \|\sigma_{2\tau}(I_D)\|_0 - \|\delta_\tau(k_p)\|_0 \quad (11)$$

where both F and k_p are sparse such that $\|\sigma_\tau(F)\|_0$ and $\|\delta_\tau(k_p)\|_0$ are significantly smaller than $\|\sigma_{2\tau}(I_D)\|_0$ due to the non-sparsity of I_D . So we come to $\phi(k_p, I_D) \gg \phi(G, F)$.

2 Fourier transform of 2D-Gaussian function.

(1) For the two-dimensional Gaussian function $f(x, y)$,

$$f(x, y) = \frac{e^{-\left(\frac{x^2}{\sigma_x^2} + \frac{y^2}{\sigma_y^2}\right)}}{2\pi\sigma_x\sigma_y} \quad (12)$$

7 where σ_x and σ_y is the variance in two orthogonal directions respectively. After two-dimensional
 8 Fourier transform:

$$F(u, v) = \sum_x \sum_y f(x, y) e^{-j2\pi(ux+vy)} \quad (13)$$

$$= e^{-2\pi^2(\sigma_x^2 u^2 + \sigma_y^2 v^2)} \quad (14)$$

$$= A e^{-\left(\frac{u^2}{2\sigma_u^2} + \frac{v^2}{2\sigma_v^2}\right)} \quad (15)$$

$$\sigma_u \propto \frac{1}{\sigma_x}, \sigma_v \propto \frac{1}{\sigma_y} \quad (16)$$

9 Where σ_u and σ_v denote the new variance of the Gaussian function after transformation. Discrete
 10 Fourier Transform (DFT) result $F_g(u, v)$ for *Gaussian kernel* is also in *Gaussian form*, and their
 11 variances are in *inverse proportion*¹.

12 3 Limitations

13 (1) As described in Section 3.1 of this paper, same with most previous blind SR methods, our method
 14 is also based on convolution and downsampling degradation model to describe the real degradation
 15 process, which is the common setting. But this description may not cover all forms of degradation,
 16 such as non-uniform degradation (kernel each local area may be different) and motion synthesis using
 17 aliasing of adjacent frames. This needs further research and exploration in future work.

18 (2) Compared with the previous work, we provide a more accurate and efficient blind blur kernel
 19 estimation scheme. Combined with the existing efficient non-blind SR methods, we achieve the best
 20 blind SR results. Since the proposed estimation scheme is task independent and we mainly focus on
 21 blind-SR, it may also be suitable for some other blind task scenarios such as deblurring, which needs
 22 more future exploration.

23 4 More quantitative and visual results

24 In addition to the fidelity-oriented blind-SR experiment in the main text, we conducted additional
 25 perceptual-oriented experiments. Same as the previous experimental setup, we use ESRGAN and
 26 LPIPS perceptual metric to compare the results of 2×, 3×, 4× blind-SR results on LR images from
 DIV2K degraded by random Gaussian kernels, as shown in the Table 1.

Method	DIV2K			Flicker2K		
	2x	3x	4x	2x	3x	4x
ESRGAN	0.4969	0.5757	0.6315	0.4881	0.5719	0.6269
FCA	0.2799	0.3527	0.3818	0.2627	0.3488	0.3661
KernelGAN	0.2275	0.3159	0.5774	0.2371	0.3331	0.6141
Ours	0.1968	0.2569	0.3390	0.1987	0.2706	0.3400

Table 1: Quantitative [LPIPS↓] comparison of perception-oriented SR results for 2×, 3×, 4× up-sampling respectively. The best performance is shown in red and the second best is blue.

27 Here we also provide a comparison of blind SR performance on the additional synthetic dataset L20
 28 in Table 2. And more visual comparison with state-of-the-art methods as provided and shown in
 29 Figure 1, 2, 3 and Figure 5, we show the visual contrast of the *best* methods.
 30

31 5 Code, data, and instructions needed to reproduction

32 We provide the code, instructions and dataset with download address for reproduction in the attached
 33 zip file.

¹Reflect in the major and minor axis of the projection boundary on the position coordinate plane

Table 2: **Quantitative [PSNR \uparrow / SSIM \uparrow] comparison results of fidelity-oriented SR model for 2 \times , 3 \times , 4 \times up-sampling.** G, M denote Gaussian kernels and motion kernels respectively. The best performance is shown in red and the second best in blue.

Figure 1: 2 \times blind SR results for LR degraded with unknown kernel from DIV2K. For FCA is not able to handle motion kernel, so we use Pan *et al.*'s as a comparison instead. Due to more accurate kernel estimation, our method achieves the most pleasant results compared with other methods.

Figure 2: 2 \times blind SR results for LR degraded with unknown Gaussian kernel from DIV2K.

Figure 3: $2\times$ Blind SR results for LR degraded with unknown Gaussian kernel from DIV2K.

Figure 4: $2\times$ Blind SR results for LR degraded with unknown motion kernel from Flickr2K.
